I have no conflict of interest concerning this presentation

Global Evidence Summit Prague, 10-13 Sept 2024

Introduction

- We conducted a LSR to evaluate safety and effectiveness of COVID-19 vaccines administered to pregnant persons.
- The great amount of evidence, the number of outcomes, and the subgroups of interest allow a large number of meta-analyses.
- We developed an interactive tool allowing tailored meta-analyses by selecting filters according and subgroups by outcome.

Objective

To present the evidence map and the tool developed for interactive real-time meta-analyses using the shiny R library.

Drug Safety

Safety and Effectiveness of COVID-19 Vaccines during Pregnancy: A Living Systematic Review and Meta-Analysis

Agustín Ciapponi; Mabel Berrueta; Fernando J. Argento; Jamile Ballivian; Ariel Bardach; Martin E. Brizuela; Noelia Castellana; Daniel Comandé; Sami Gottlieb; Beate Kampmann; Agustina Mazzoni; Edward P.K. Parker; Juan M. Sambade; Katharina Stegelmann; Xu Xong; Andy Stergachis; Pierre Buekens.

Up-to-date evidence-based information on emerging vaccines in pregnancy and childhood

Our platform includes:

- ❑ LSR-based evidence syntheses
- ❑ Link to included studies
- ❑ Safety, effectiveness, and immunogenicity outcomes
- ❑ Real-time comparative and proportional meta-analyses customizable by subgroups and filters.

Forest Plot / Meta-analysis Summary table

We identified 32 studies reporting this outcome. Based on the methodology described, only 4 studies reported adjusted effect measures for this outcome: Dick, A (2022) (a), Fell, D.B. (2022), Magnus, M.C. (2022), Hui, L 2023. Finally, 4 were included in the meta-analysis based on the selected filters. The meta-analysis included a total of 113,250 patients exposed to the vaccine in 5 countries: Australia, Canada, Israel, Norway and Sweden.

Maternal safety of COVID-19 vaccines during pregnancy versus unvaccinated pregnant population: Stillbirth.

Para cualquier trimestre las vacunas ARNm/vector viral mostraron un RR de 0,49 (0,20 a 1,19)

Analysis parameters

Outcome type

- Infant safety outcomes following COVID-19 vaccination during pregnancy
- Maternal-Pregnancy related outcomes
- Maternal-Adverse events following immunizations

Outcome

Stillbirth

- Trimester

Video Guide to Interpreting Proportional Meta-analyses (2.36 min)

Por tipo de vacuna o por trimestre de exposición, la incidencia de muerte fetal en embarazadas vacunadas es similar a las tasas históricas.

Esta ruta se puede replicar para cada resultado.

outcomes

Infant safety

Effectiveness

Should vaccination vs. no vaccination be used in pregnancy?

Outcomes	Absolute Effect With no vaccination With vaccination	Relative effect (95% CI)	Certainty of the evidence GRADE
<p>Stillbirth, after the mother's vaccination in 1st or 2nd trimester with mRNA or viral vector vaccine</p>	<p>5 per 1000 1 per 1000</p> <p>Difference: 4 fewer per 1000 patients (95% CI: 4 to 3 fewer per 1000 patients) Based on data from 7107 patients in 1 study</p>	<p>RR 0.17 (0.07 to 0.43)</p>	<p>⊕⊕⊕⊕ LOW</p>

- ▶ Stillbirth, after the mother's vaccination in 2nd trimester with mRNA or viral vector vaccine
- ▶ Stillbirth, after the mother's vaccination in 3rd trimester with mRNA or viral vector vaccine
- ▶ Stillbirth, after the mother's vaccination in any trimester with mRNA or viral vector vaccine

Should vaccination vs. no vaccination be used in pregnancy?

Outcomes	Absolute Effect		Relative effect (95% CI)	Certainty of the evidence GRADE
	With no vaccination	With COVID-19 vaccination		
<p>▼ NICU hospitalization - 1st trimester (mRNA vaccines)</p>	<p>56 per 1000</p>	<p>48 per 1000</p>	<p>RR 0.86 (0.674 to 1.097)</p>	<p>⊕⊕⊕⊕ LOW</p>
	<p>Difference: 8 fewer per 1000 patients (95% CI: 18 fewer to 5 more per 1000 patients) Based on data from 5602 patients in 1 study</p>			

- ▶ NICU hospitalization - 2nd trimester (mRNA, Viral vector vaccines)
- ▶ NICU hospitalization - 3rd trimester (mRNA, Viral vector vaccines)
- ▶ NICU hospitalization - Any trimester (mRNA vaccines)

Should vaccination vs. no vaccination be used in pregnancy?

Outcomes	Absolute Effect		Relative effect (95% CI)	Certainty of the evidence GRADE
	With no vaccination	With COVID-19 vaccination		
<p>▼ Severe or hospitalized COVID-19 in mothers - mRNA vaccine (omicron/alpha/other dominance)</p> <p>Follow-up: range 31 days to 365 days</p>	<p>31 per 1000</p>	<p>1000 per 1000</p> <p>Difference: 969 more per 1000 patients (95% CI: 86 to 13 fewer per 1000 patients) Based on data from 34495 patients in 4 studies</p>	<p>OTHER 72 (42 to 86)</p>	<p>⊕⊕○○ LOW</p>

▶ Severe or hospitalized COVID-19 in mothers - Inactivated vaccine (omicron/delta/other dominance)

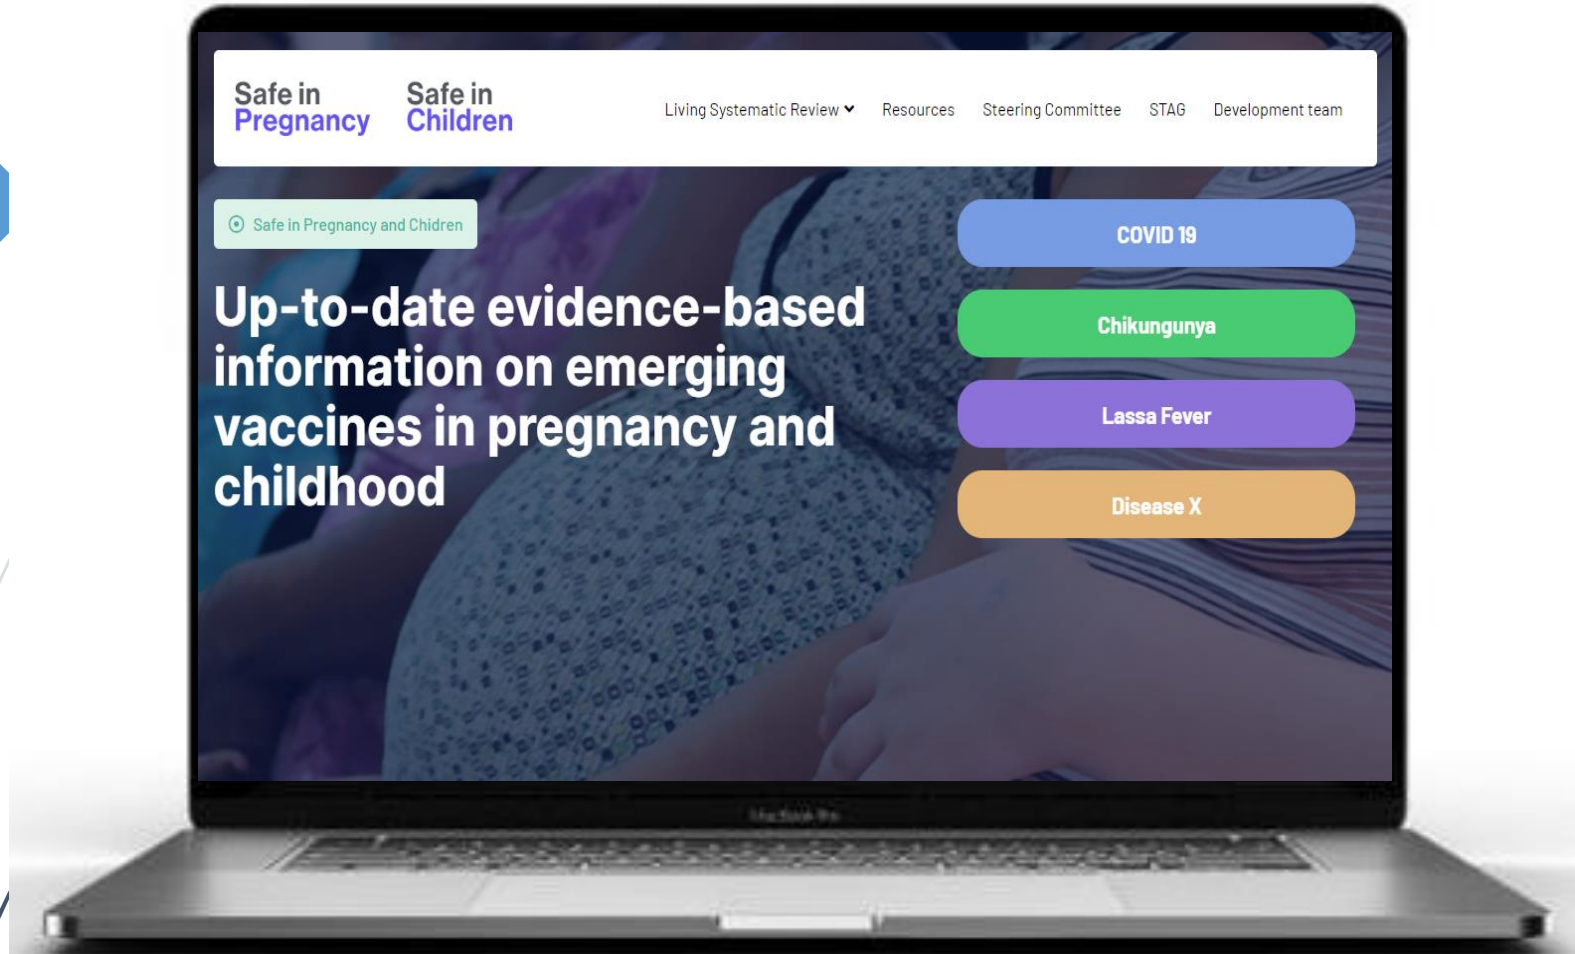

▶ Severe or hospitalized COVID-19 in mothers - Viral vector (omicron dominance) Follow-up: range 1 months to 9 months

▶ Severe or hospitalized COVID-19 in mothers - mRNA/viral vector vaccine (omicron dominance) Follow-up: range 13 days to 365 days

Conclusions

We consider that the tool developed is useful for decision-makers in the area of health, since it allows to visualize and have the synthesis of relevant evidence, and specific according to their specific needs regarding the possible benefits and harms of vaccines against COVID-19 for pregnant people.
