METODOLOGY

- PROSPERO ID CRD42023410959
- The search strategy: **Cochrane Central, Lilacs, Medline, Embase and gray literature**
- The risk of bias was assessed with **RoB2**.

- A **network meta-analysis: random effects model** with inverse variance method and standardized mean difference effect measure.
- The certainty: **GRADE**.

RESULTS

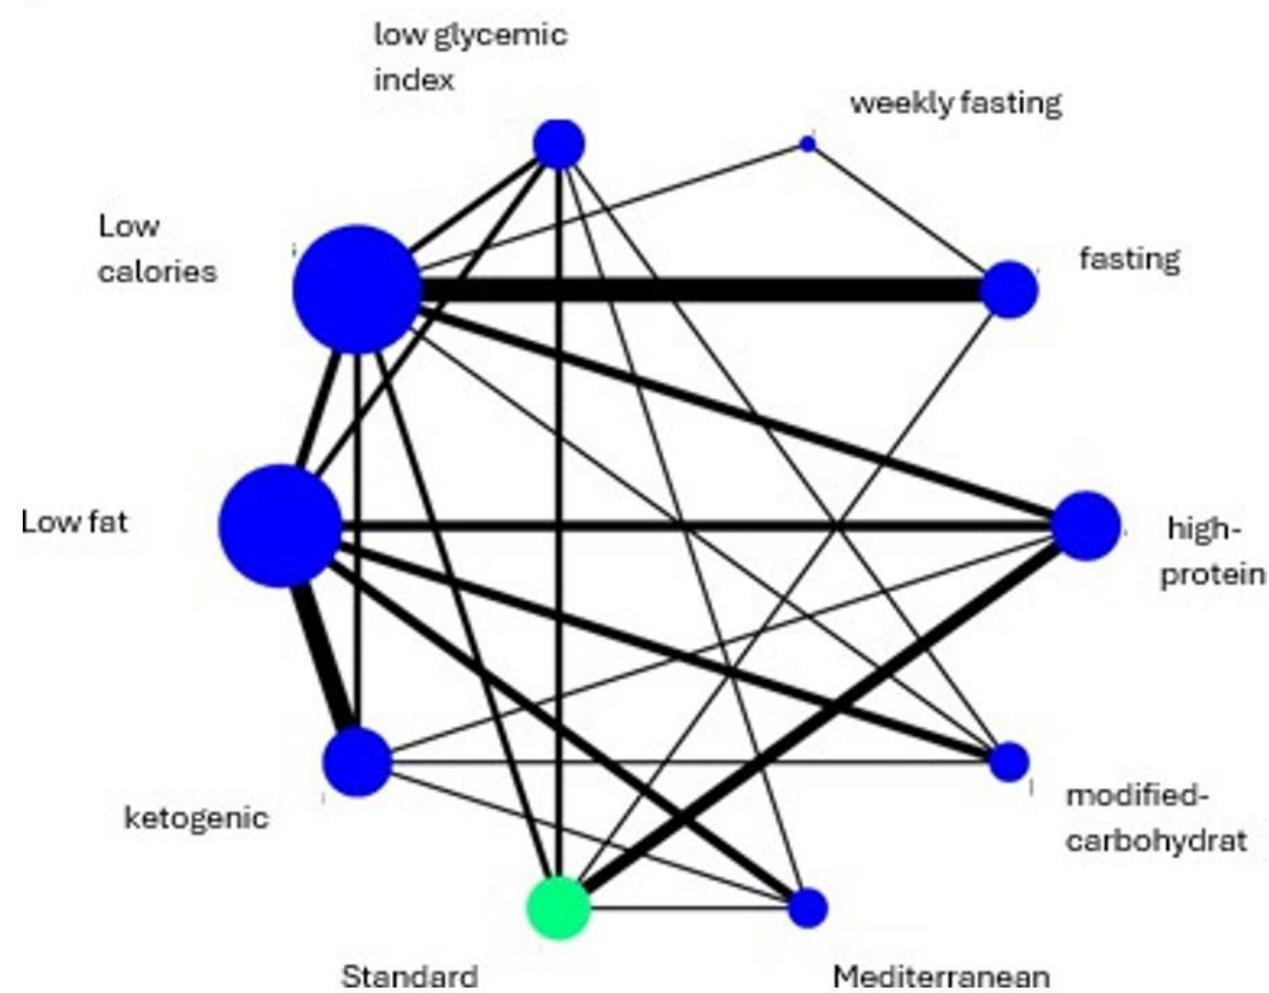

Figure 1. Weight loss: Greater effectiveness with low glycemic index diet.

CONCLUSIONS

The certainty of the evidence ranged from moderate to low.

The **low glycemic index diet** has better results in **weight loss** when compared to other nutritional therapies, however, are the most likely to cause weight gain. More studies are required that can **strengthen this conclusion**

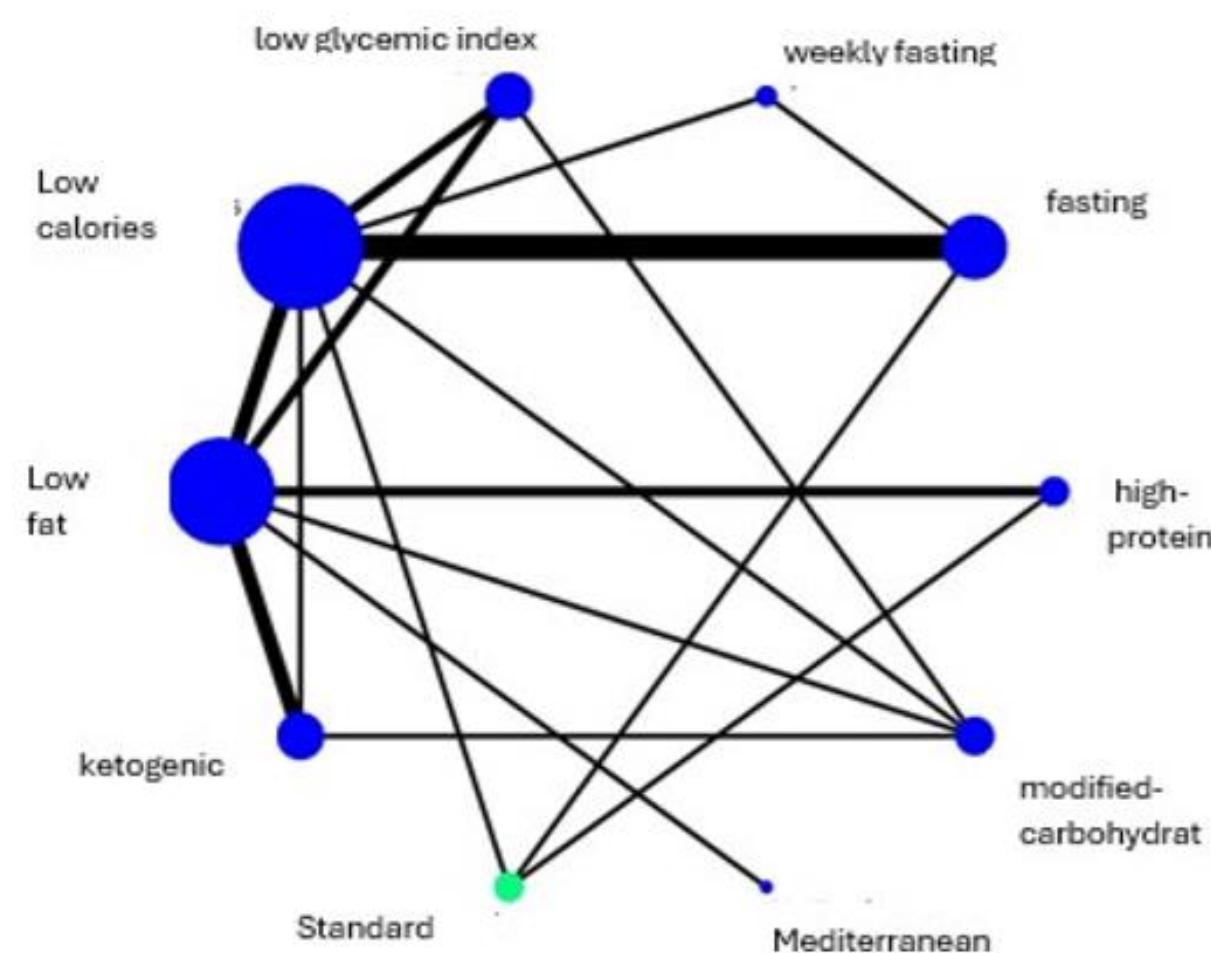

Figure 2. Loss maintenance: Low fat diet showed less weight regain.

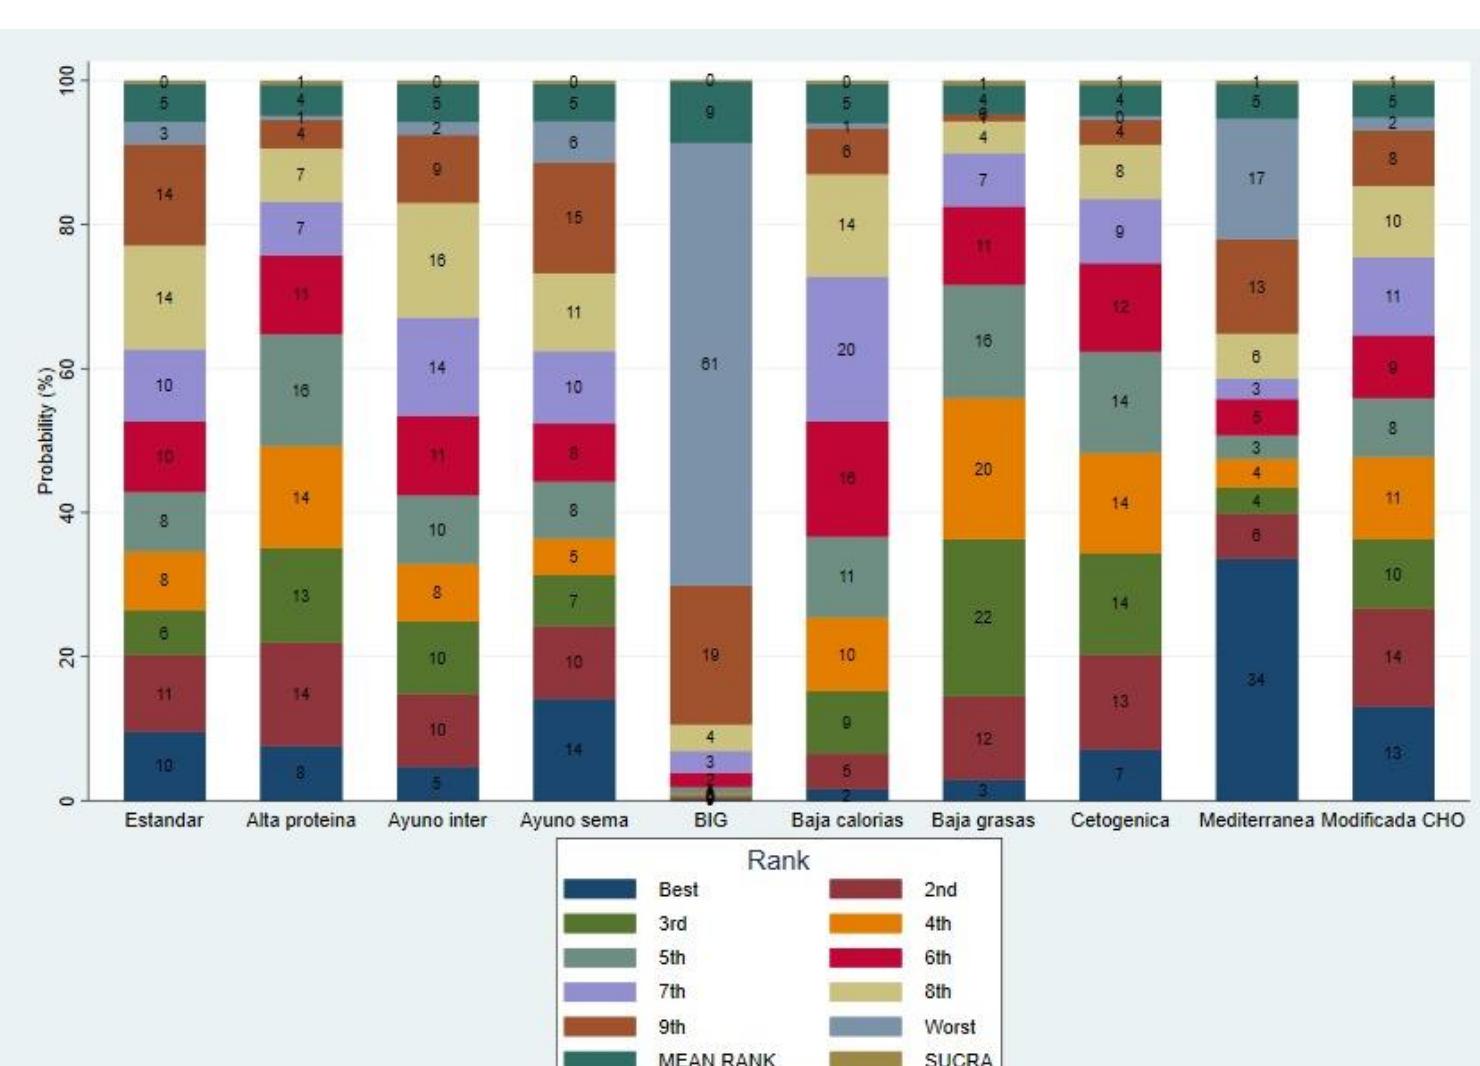

Figure 3. Rankogram for weight loss maintenance.
